

LATISSE

Latisse® is a new medication from the makers of Botox® which was discussed by Dr. Etai Funk of The Bressler Center on ABC evening news after the Oscars this year. It was discovered after its use in glaucoma patients resulted in significantly longer, thicker, and darker lashes in patients. Now it is available for cosmetic use.

It is available in Texas only by prescription and applied nightly using a brush to the upper eyelid at the base of the eyelashes. Patients should begin to see results at 8 weeks and full results at 16 weeks. Studies have demonstrated the following at 16 weeks:

- 25% increase in length of their eyelashes
- 106% increase in thickness/fullness of their eyelashes
- 18% increase in darkness of their eyelashes

Side effects occurred in less than 4% of patients which included eye irritation, redness, or darkened skin at the area of application.

At The Bressler Center we feel that Latisse® is a revolutionary prescription medication to give you the long luscious lashes you have always desired. Call our office today and schedule an appointment to obtain your prescription.
